A. References

1. Background and Rationale

The primary goal of the current study "Human Connectome Project for Early Psychosis" is to acquire high quality data consistent with the data acquired as part of the original HCP. In this project we focus on early phase psychosis (both affective and non-affective psychosis), within the first 5 years of the onset of psychotic symptoms.

The significance of this protocol is fourfold: 1) we address an important problem, early phase affective and non-affective psychoses, within 5 years of the initial onset of psychotic symptoms. This is an important cohort to study given that this is a time period early in the course of illness when there are fewer confounds such as prolonged medication exposure and the effects of chronicity, and it is also a time period when treatment intervention strategies may be most effective. Moreover, there is strong evidence that there are both common and distinct brain processes underlying these cohorts (e.g., Berrettini 2003; Murray et al., 2004; Baker et al., 2014). Accordingly, we have acquired a large volume of high quality data on these cohorts using the HCP Lifespan acquisition protocols for imaging, behavior, and cognition. 2) High quality data is maintained by performing data analysis and quality control procedures consistent with the original HCP.

Here we have used the HCP Lifespan imaging sequences at Brigham and Women's Hospital (BWH), McLean Hospital, and at Indiana University (IU). 3) We are also providing novel and modified tools that can be used in any HCP study, which can be downloaded from a public github repository for general use by the scientific community (https://github.com/pnlbwh). These tools include a new signal drop detection algorithm to facilitate data quality check, a multi-tensor tractography algorithm (Malcolm et al., 2010), essential to extract accurate connectomes from high angular resolution HCP data, a harmonization algorithm for diffusion magnetic resonance imaging (dMRI) data acquired across sites (Mirzaalian et al., 2015), and an algorithm that estimates free water from dMRI (Pasternak et al., 2009). Lastly, as part of a separate project (R01MH117012), participants are evaluated at two follow-up timepoints in order to map brain, cognitive and clinical trajectories during this early course of illness compared to controls. **Note HCP-EP Release 1.0 includes only baseline measures.** Longitudinal follow-up data are included under a separate NDA collection (Collection Title: Neuroprogression across the Psychosis Spectrum in the Early Course of Illness; Collection ID: C3179).

2. Clinical Research Sites

A total of 183 subjects have completed study measures and are included in the September 2020 HCP-EP Release 1.0 on NDA. (34 affective and 91 non-affective psychotic patients and 58 matched healthy controls). See Table 1 for enrollment by site for subjects in this data release. Below we describe the 4 clinical recruitment sites:

Indiana University (IU) Psychotic Disorders Program, Prevention and Recovery for Early Psychosis (PARC). Eskenazi Midtown Community Mental Health PARC is a specialty program for early psychosis located in Indianapolis, Indiana and is an affiliate of Indiana University. PARC is the only comprehensive early psychosis specialty program in central Indiana and serves a

population of over 1 million. Founded in 2009 by the study Multiple-PI Dr. Breier, and currently directed by him, PARC is a comprehensive treatment clinic, training program, and research center. PARCs recruitment program is funded by federal and state grants. PARC averages 7 new intakes per month (84 annually).

Beth Israel Deaconess Medical Center – Massachusetts Mental Health Center (BIDMC-MMHC), Prevention of and Recovery from Early Psychosis (PREP) Program. The early psychosis program at BIDMC-MMHC, directed by Dr. Keshavan (BIDMC Site-PI), began in the 1990's as a clinical psychopharmacology program and includes the PREP clinical outpatient program, the CEDAR (Center for Early Detection, Assessment and Response to Risk) High Risk ("prodromal") outpatient program, and an inpatient psychiatry unit. Referrals to the CEDAR clinical and research program are approximately 75/year and many of these putatively prodromal individuals have had a first episode of psychosis and are referred into first episode programs. PREP receives approximately 100 referrals annually, and usually maintains a census of 50 patients.

McLean Hospital, McLean On Track. McLean On Track is a specialty first episode psychosis program within the Psychotic Disorders Division at McLean Hospital, where Dr. Öngür (McLean Hospitla Site-PI) is Chief. McLean on Track usually maintains a census of about 100 patients. Patients meeting study criteria will also be referred by treating physicians from the McLean Psychotic Disorders inpatient units where Dr. Ongur is also Chief.

Massachusetts General Hospital (MGH), First Episode and Early Psychosis Program (FEPP). FEPP is a specialty research and clinical program within the Schizophrenia Clinical and Research Program (SCRP), Department of Psychiatry of MGH. It is located in the outpatient department of MGH. Patients meeting study criteria will also be referred by treating physicians on the MGH Wang 8 inpatient unit. The majority of FEPP patients participate in research. The FEPP program usually maintains a census of about 80 patients. Dr. Holt is the Site-PI.

Table 1	July 2020		
Sites	Patient	Control	Total
IU	61	25	86
BIDMC	23	8	31
MGH	10	12	22
McLean	31	13`	44

 Table 1. Anticipated Subject Completion During the Study Period

3. Study Population (Inclusion/Exclusion Criteria)

183

Medically stable male and female subjects with a confirmed psychiatric diagnosis and healthy control subjects were enrolled in the study.

Inclusion Criteria (all three subject cohorts):

- 16 to 35 years of age at study entry
- Male or female

125

- Ability to provide informed consent or have a legal authorized representative or guardian
- Outpatient

TOTAL

- Fluent in English.
- Female subjects of childbearing age report that they are not pregnant and must test negative on a urine pregnancy test at the MRI visit.*
- Willing to share de-identified data with the Connectome database
- Meets additional inclusion criteria for one of the three subject cohorts described below

Cohort 1: Non-Affective Inclusion Criteria:

• DSM V* * diagnosis of schizophrenia, schizophreniform, schizoaffective, psychosis NOS, delusional disorder, or brief psychotic disorder with onset within the past five years prior to study entry

Cohort 2: Affective Inclusion Criteria:

• DSM V** diagnosis of major depression with psychosis (single and recurrent episodes) or bipolar disorder with psychosis (including most recent episode depressed and manic types) with onset within five years prior to study entry

Cohort 3: Healthy Control Inclusion Criteria***:

- Does not meet the criteria for meet criteria for bipolar and related disorders, major depressive disorder (recurrent) or schizophrenia and other psychotic disorders
- Does not meet criteria for current anxiety disorder
- Anxiety disorders are allowable if the total duration of the illness was less than 12 months; has been in remission for at least 12 months; and did not require the use of medication to treat anxiety
- Does not have a first-degree family member diagnosed with a schizophrenia spectrum disorder
- Free of psychiatric medications at the time of study entry
- No history of psychiatric hospitalization

Exclusion Criteria (all three subject cohorts):

- Substance-induced psychosis or psychotic disorder due to a medical
- Known IQ less than 70 based on medical history* *
- Subjects with known medical history of Human Immunodeficiency Virus positive (HIV+) status
- Subjects with an active medical condition that affects brain or cognitive functioning (eg. seizure disorder, epilepsy, head trauma, stroke, traumatic brain injury, significant loss of consciousness, or other neurological disorder) in the site principal investigator's opinion
- Subjects with implanted pacemaker, medication pump, vagal stimulator, deep brain stimulator, TENS unit, ventriculoperitoneal shunt, or other contraindication to undergoing an MRI scan
- Current severe substance use disorder in past 90 days (excluding caffeine and nicotine)
- ECT treatment in past 12 months
- Subjects considered a high risk for suicidal acts active suicidal ideation as determined by clinical interview OR any suicide attempt in 30 days prior to screening
- Subjects who demonstrate overtly aggressive behavior or who are deemed to pose a substantial risk of danger in the Investigator's opinion

* Female subjects, including minors, who tested positive for pregnancy were informed at the time of testing. Site PI's were informed and addressed this issue with subjects on an individualized case by case basis.

* * Inclusion/Exclusion criteria related to diagnosis and IQ are based on history and the patient phone screen and were confirmed during the screening assessments by the SCID-5-RV and the WASI-II, respectively.

*** Healthy control inclusion criteria are based on reported history and the healthy control phone screen but were confirmed during the SCID-5_RV screening assessment.

4. Study Procedures

The following assessments and procedures were completed by study personnel trained to administer the instruments and were based on interviews with the subject or questionnaires completed by the subject.

4.1 Clinical Assessments and Procedures

Whenever possible all clinical assessments and procedures were administered to all subjects regardless of subject cohort unless otherwise specified. Clinical Assessments and procedures, including NIH Toolbox measures and additional cognitive assessments, for Boston area subjects occurred at BIDMC-MMHC, McLean Hospital, and MGH. MRI scans for Boston area subjects occurred at BWH, BIDMC, or McLean Hospital. Clinical and cognitive assessments and MR scans for IU subjects occurred at the IU School of Medicine,

Timing of Measures: The NIH Toolbox measures were completed in approximately 1.5 to 2 hours, the non-toolbox HCP Lifespan measures, and the additional HCP early psychosis measures took, on average, 2 to 2.5 hours to complete. All subjects were given breaks as needed. Testing occurred over two or more days but within days of the imaging.

Screening Assessments: In addition to the measures listed below, all subjects completed a screening interview where demographics, family psychiatric history, screening for history of traumatic brain injury and contraindication to MRI testing were assessed.

Medical History: The subject's lifetime medical history were assessed during the screening period. Medical history included previous and current diseases and lifetime and current substance use. All concomitant medications were recorded in the source documentation. In order to address the potential effects of antipsychotic drugs on structural and functional indices lifetime antipsychotic medication dosage as CPZ equivalents using the Gardner approach (Gardner et al., 2010) were calculated for non-affective and affective subject cohorts.

Structured Clinical Interview (SCID-5-RV) (First et al., 2015), in conjunction with medical records and/or clinical interviews was administered to all subjects, both patients and healthy controls, to rule out patient subjects who were not psychotic or who had a psychosis that was related to substance abuse or to an organic disease. The SCID-5-RV was also used to confirm that healthy control subjects did not meet criteria for bipolar and related disorders, major depressive disorder (recurrent) or schizophrenia and other psychotic disorders.

NIH Toolbox Measures

The following battery was included in the NIH Toolbox Measures (NIH Toolbox, 2013; Toolbox-CB, 2013; McDonald, 2014; Hodes et al., 2013).

- *Cognition* (Picture Sequence, Dimensional Change, Flanker, Picture Vocabulary, Pattern Completion, List Scoring, and Oral Reading)
- *Emotion* (Self-report emotion)
- Sensation (Words in Noise, Odor Identification, and Dynamic Visual Acuity)
- *Motor* (9-Hole Pegboard, and Grip Strength)

Additional Cognitive Assessments

- *HCP Lifespan Measures* (Gur et a., 2001; Gur et al., 2009).
 - Delay Discounting
 - Penn Emotion Recognition
- WASI-II (Wechsler, 2011)
- *Seidman Auditory Continuous Performance Test* (CPT; Seidman et al., 1998; Seidman et al., 2012)

Positive and Negative Syndrome Scale (PANSS) (Kay et al., 1987) is an assessment instrument for general psychopathology and positive symptoms. The PANSS contains 30 items that assess symptoms of psychotic disorders including positive, negative and general psychopathology. The PANSS was chosen because of its widespread use in clinical studies of psychosis, and its demonstrated reliability in assessing psychopathology across diverse patient populations.

Hollingshead Two-Factor Parental Socioeconomic Status Scale (Hollingshead, 1957) Parental SES is a standard matching variable in psychosis imaging studies because of the downward socio-economic drift associated with these illnesses.

Clinical Assessment Interview for Negative Symptoms (CAINS) (Kring et al., 2013; Forbes et al., 2010; Horan et al., 2011). This is a 13-item negative symptom scale developed and endorsed by the NIMH's Consensus Development Conference on Negative Symptoms. We selected it because of its high reliability and the validation of two key factors - affect and avolition/motivation – that may be used for domain specific analyses.

Young Mania Rating Scale (YMRS) (Young et al., 1978). This is an 11-item clinician administered assessment scale for mania and one of the most commonly used scales to assess severity of mania.

Montgomery-Asberg Depression Rating Scale (MADRS) (Montgomery and Asberg, 1979). This is a 10-item clinician administered depression rating scale that has established reliability in both schizophrenia and mood populations.

MIRECC Global Assessment of Functioning (GAF) (Niv et al., 2007) provides global assessments of symptoms, work/school and social functioning. The GAF is commonly used in early stage psychosis studies.

4.2 MRI Procedures

MRI Data Acquisition Protocol (duration = approximately 70 minutes)

This project used three Siemens MAGNETOM Prisma 3T scanners at BWH, McLean, and IU. BWH and IU used a 32-channel head coil. The McLean used a 64-channel head & neck coil, with the neck channels turned off. All protocols were based on the 2016 CCF template protocol. Detailed imaging protocols for the three imaging sites are in Appendix 1.

In short, the protocol scan sequences were:

- T1w (MPRAGE) and T2w (SPACE) structural scans of 0.8mm isotropic resolution.
- Resting state fMRI (rfMRI) of 2mm isotropic resolution, multiband (MB) acceleration factor of 8, TR 720ms, acquired twice: once with AP and once with PA phase encoding.
- Diffusion MRI (dMRI) 1.5mm isotropic, MB acceleration factor of 4, 92 directions in each shell (b=1500 and 3000) acquired twice: once with AP and once with PA phase encoding. The first two acquisitions include 3 additional directions at b=200 and 6 directions at b=500 to improve modeling of fast diffusion processes such as free water.
- In addition, field maps were acquired to correct for intensity and geometric distortions.

Positioning and motion: Subjects were instructed to remain still during scanning and deformable foam cushioning was used to stabilize the head. Real time image reconstruction and processing were used for quality assurance at the time of scanning. If there were any detectable problem the scan was repeated. Noise: Noise-attenuating headphones and ear stopples were used and provided excellent noise reduction while still permitting adequate auditory perception.

5. HCP-EP Release 1.0 Data

5.1 Getting Data and using NDA

Request Access to NDA

Qualified researchers can request access to HCP-EP and other Connectome Coordination Facility (CCF) shared data from the <u>NIMH Data Archive</u> (NDA). NDA access for CCF data is being granted by the same NIH permissions committee as for ABCD data. Thus, if you have already obtained access for ABCD data, you will also have access to CCF data and vice versa.

To get started, <u>create an NDA account or login</u> to your existing one. After login, go to your account's <u>Data Permissions dashboard</u>. Here you can request or renew access electronically to one or many repositories in NDA, including CCF and others.

In the Actions column in the ABCD/CCF Permissions group row, select "Request Access" and complete the access request instructions to create a signed Data Use Certification (DUC). It can take up to 10 business days to process your request for access.

NDA Permission Groups

All NDA Broad Use and Open Access Permission Groups are listed in the table below. Select the Action button to review instructions or initiate a request to access the data in an NDA Permission Group.

Permission Group	Description 0	Requires Institutional Approval 0	Status 0	Actions	
NIMH Data Archive	Phenotypic, imaging and genomic data as well as supporting documentation for NIH funded grants. Data Access Requests will be reviewed by the NDA Data Access Committee.	~		Actions -	
Osteoarthritis Initiative	The National Institute of Arthritis and Musculoskeletal and Skin Diseases Osteoarthritis Initiative. Data Access Requests do not require Institutional sponsorship and will be approved immediately upon submission of a completed request.			Actions - Instructions	
Adolescent Brain Cognitive Development (ABCD) / Connectome Coordination Facility (CCF)	ABCD is a data repository that houses all data generated by the Adolescent Brain Cognitive Development (ABCD) Study. CCF is a data repository that houses all data generated by the Human Connectome Projects. Data Access Requests to ABCD/CCF will be reviewed by the ABCD Data Access Committee. Approved users will have access to both the ABCD and CCF data repositories.	~	Access expires in 351 days.	Request Access	

There are three criteria you must meet to be eligible to request NDA access:

- 1. You must have a research-related need to access the data
- 2. You must be associated with an NIH-recognized research institution, defined as an institution registered in the NIH electronic research administration system (eRA Commons,) and have the approval of an authorized signatory official of that institution.
- 3. Your institution must have an active Federalwide Assurance (FWA).

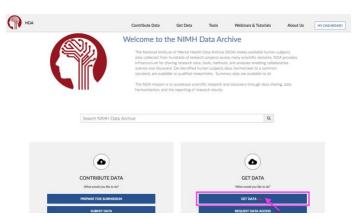

If you do not know whether or not you meet these, for example if you are unsure of who at your institution is an authorized signing official, do not know whether your institution has an FWA, or have any other questions, please view NDA's tutorials or email NDAHelp. If you are unable to complete the automated Data Use Certification (DUC) process from the Data Permissions dashboard, you can also complete the PDF manually and email a signed copy to NDAHelp@mail.nih.gov.

Once approved, access is valid for one full year. To maintain access, a renewal request should be submitted through the same process as above.

Selecting and Downloading Data

To obtain all or a subset of the data in the HCP-EP 1.0 Release, go to the HCP Featured Datasets query page. You can also get to this page by selecting "Get Data" from the NDA home page, then selecting "Human Connectome Projects (HCP)" at the top left of the query page.

On the <u>HCP Featured Datasets query</u> page, the user has two options for accessing the HCP-EP data. Option One is to access the full release of data as a shared HCP-EP package (1.3 TB) that

includes unprocessed structural MRI, resting state fMRI, and dMRI data; preprocessed structural MRI, and available behavioral data from 183 subjects. Click on "Access Shared Data Packages", then on the Packages page, in the Actions column in the HCPEPRelease row, select "Add to My Data Packages". It will take a few minutes to add the package to your account and there should

HUMAN

Connectome PROJECT for Early Psychosis

be a notification at the top of the page when it is complete. In the meantime, you can proceed with downloading and setting up the Download Manager.

From the Packages dashboard, click the Download Manager button to download the DownloadManager.jnlp Java launch application. Click on the Download Manager Instructions button for operating system-specific instructions on setting up Java 8, which is required for the Download Manager to run. If you are using a Mac OS, you may need to set your System Preferences, Security & Privacy settings to allow the DownloadManager.jnlp file to open. You may need to add an exception for the https://nda.nih.gov URL in the JRE configuration to allow the application to run.

Click Run, and enter your NDA username and password when prompted. In the Save to: field, enter the path to the directory in which you wish to download the data (make sure it has sufficient space available). If you don't see the HCPEPRelease or your custom package listed, click the Refresh Queue button until it appears with the status of "Ready to Download". Click the checkbox to the left of the package you wish to download and click the Start Downloads button.

Option Two allows the user to select filters to access part of the released data by clicking the dropdown options under HCP-EP Release 1.0 Available Datasets. Click the black "i" information buttons to see a description of the subset package. Select the checkboxes of the subset of the data vou are interested in and click the Add to Workspace button at the bottom of the page.

Note: these subset package filters will include data from all released subjects. If you are interested in downloading one or a few subjects, first package and download only the Behavioral Data, choose desired subjects and use the Query by Global Unique Identifier (GUID) tool to create a filter for only GUIDs you enter. You may add a GUID filter and any number of data package filters to the workspace at the same time or serially.

Once you are done adding filters, click the Filters funnel icon at the top right to review your filters and click the Submit to Filter Cart button. It can take several minutes to update the Filter Cart at the top right. When finished, click the Package/Add to Study button. On the landing page, click the Create Package button to create your custom package with the data you've selected. Enter a Package Name, be sure to click the "Include associated data files" checkbox (MRI data are considered associated data files), and click Create Package. The process of creating the package will take several minutes and can be tracked from your Packages Dashboard, with "My Packages" selected at the top left. While you are waiting, follow the instructions above to

download the Download Manager and click the Refresh Queue button until your package is ready to download.

When you want to open the Download Manager again at a later time, open the DownloadManager.jnlp file you originally downloaded and follow the prompts. If you click the Download Manager button in NDA, it will download a second copy of the file rather than launch the application.

5.2 Files and Directory Structure

The user may choose to download the MRI unprocessed data, preprocessed structural data and the behavioral data by selecting prepackaged data or choose to create their own custom package as described above.

Note: The age of each subject recorded in the imaging, general demographics, and behavioral instruments may be inconsistent, because the time interval between subject consenting, MR scanning, and behavioral assessments was sometimes large (on the order of a few months).

The data package will download to the Save To: location on your file system with the top directory name matching the package name (<YourPkgName>, or, e.g., HCPEPRelease).

If your package contains Minimally Preprocessed Image Data, and Unprocessed Image Data, the high-level <YourPkgName> directory will contain:

<yourpkgname>/</yourpkgname>	
fmriresults01/	Preprocessed data (currently only Structural MRI)
fmriresults01.txt	Info on preprocessing pipelines run (per subject)
imagingcollection01/	Unprocessed data
imagingcollection01.txt	Listing of per subject data (by modality) in collection
md5_values.txt	md5 checksums for download verification
package_info.txt	Info on NDA filters used to create package
README.pdf	automatic README from NDA

We are using the NDA data structures fmriresults01 and imagingcollection01 (full directory structure described in Appendix 2) to organize the preprocessed and unprocessed, respectively, per subject data into the same directory structure as that of previously released HCP Young Adult data, so that it is compatible with the expected inputs and outputs of processing through the HCP Pipelines.

The fmriresults01/ directory contains the preprocessed data, currently structural preprocessing outputs only, for the subjects available. The imaging collection 01/ directory contains unprocessed data of all modalities

Under these two directories, are high level <SubjectID_01_MR>, directories and a manifests directory. Manifests are JSON files (*.json) that organize related data (e.g. unprocessed REST1 data) into a structured set of files to be downloaded according to the directory structure specified. In this case, we have used the manifests to organize the data into per subject, unprocessed and processed "packages" as we did for the HCP Young Adult Study in the directory structure output by and required for input to the HCP pipelines.

5.3 Behavioral Data Structures

Behavioral and clinical measures were mapped to the NDA behavioral data structures listed below. If you include Behavioral data in your download package, tab-delimited text files for all behavioral structures you choose to include will be included in the <YourPkgName>/ directory (e.g. er4001.txt).

NDA Structure	Measure Name
<u>er4001</u>	Penn Emotion Recognition Task-40
asrm01	Mania Rating Scale
ndar_subject01	Research Subject and Pedigree, includes Phenotype
acpt01	Auditory CPT
madrs01	Montgomery-Asberg Depression Rating Scale
deldisk01	Delay Discounting Task
<u>tbi01</u>	Traumatic Brain Injury
<u>cains01</u>	Clinical Assessment Interview for Negative Symptoms
predd01	NIH Toolbox Sadness CAT Age 18+ v2.0
<u>cgi01</u>	MIRECC GAF Score Sheet
socdem01	Demographics Form
